

I plan on making a budgeting program. The main functionalities I want to have are a user, a dashboard, and the ability to add an amount as an expense, income, or savings. I want to have a very simple “login” that lets a user select a username. This will load or create their account with information from an sql lite database storing their expense, income, and savings amounts. It will fill the dashboard with the user’s information and ideally if I have time include graphs. I lastly want to have another page that simply lets the user add expense, income, and savings amount to their account (instance). I would like to use html and css for a GUI but if I will also consider just keeping it in the terminal depending on time
